ABBREVIATIONS

ACF	Action Contre La Faim Action Against Hunger
AIM	Assessments & Information Management Working Group
ARI	Acute Respiratory Infection
BPHS	Basic package of health services
BRAC	Building Resources across Community
CSO	Central Statistics Organization
CT	Care Taker
DK	Do not know
ENA	Emergency Nutrition Assessment
GAM	Global Acute Malnutrition
HAZ	Height for Age Z-Score
HH	Household
IYCF	Infant and Young Child Feeding
MoPH	Ministry of Public Health
MUAC	Mid-Upper Arm Circumference
OCHA	Office for the Coordination of Humanitarian Affairs
OW	Observed Weight
PNO	Provincial Nutrition Officer
RC	Reserve Cluster
SAM	Severe Acute Malnutrition
SD	Standard Deviation
SMART	Standardized Monitoring and Assessment of Relief and Transitions
SRS	Systematic Random Sampling
U5DR	Under 5 Death Rate
WASH	Water, Sanitation and Hygiene
WAZ	Weight for Age Z-Score
W/H	Weight for Height
WHZ	Weight for Height Z-Score
WHO	World Health Organization

ACKNOWLEDGMENT

Action Contre la Faim (ACF) would like to thank all the stakeholders and partners who provided support to the Rapid SMART Assessment in Panjwayi and Zhari districts of Kandahar province during June/July 2018.

- To Kandahar Public Health Directorate (PPHD) through Ministry of Public Health (MoPH) for taking a lead role in planning and implementation of the Rapid SMART in Panjwayi and Zhari, Kandahar province.
- To all the community members in Panjwayi and Zhari of Kandahar Province for following the survey teams to conduct the RNA assessment.
- EUROPEAN COMMISSION Humanitarian Aid and Civil Protection (ECHO) for their financial support.
- To BARAN Kabul and Kandahar field office for their smooth implementation of the Rapid SMART Assessment.
- Special thanks for AIM-WG, PND-MoPH and Nutrition Cluster for their support and cooperation to identify priority location and validating the survey methodology and results.
- To all ACF teams for providing direct and remote support throughout the survey process.

1. EXECUTIVE SUMMARY

The Rapid Nutrition Assessment was conducted between 25th June to 3rd July 2018 in Panjwayi and Zhari districts of Kandahar province using Rapid SMART method. 551 children aged 0-59 months and 518 children aged 6-59 months were assessed in 235 households out of 250 targeted households. The Rapid SMART assessment report provides an analysis and interpretation of nutrition anthropometric, child morbidity, Immunization coverage (measles), nutritional status of pregnant and lactating women as well as recommendations

Summary of Key survey findings:

Child Nutritional Status (N=518; 6-59 months children)	
Indicators	Result
GAM rate among children aged 6-59 months based on Weight for Height- Z- Score <-2 SD and/or Oedema	13.8% (10.2 - 18.5; 95% CI)
SAM rate among children aged 6-59 months based on Weight for Height Z-Score <-3 SD and/or Oedema	2.4% (1.2 - 4.6; 95% CI)
GAM rate among children aged 6-59 months based on MUAC <125 mm and/or Oedema	15.6% (11.5 - 21.0; 95% CI)
SAM rate among children aged 6-59 months based on MUAC <115 mm and/or Oedema	5.0% (3.0 - 8.2; 95% CI)
GAM rate among children aged 6-59 months based on combined criteria (WHZ <-2 SD and/or MUAC <125 mm and/or Oedema)*	22.3% (17.7 - 27.7; 95% CI)
SAM rate among children aged 6-59 months based on combined criteria (WHZ <-3 SD and/or MUAC <115 mm and/or Oedema)*	6.5% (4.1 - 10.1; 95% CI)
Stunting or chronic malnutrition among children aged 6-59 months based on Height for Age Z-Score <-2 SD	45.1% (40.3 - 50.0; 95% CI)
Underweight among children aged 6-59 months based on Weight for Age Z-Score <-2SD	23.9% (19.8 - 28.5; 95% CI)

*The combined GAM and SAM estimation was performed manually by changing all the MUAC only GAM/SAM data into Oedema in the ENA software to provide an aggregated prevalence under the result category of WHZ and/or Oedema.

Child Health and immunization (N=551; 0-59 months children)	
Indicators	Result
Children aged 0-59 months that reported of having Diarrhea during the past 14 days of the survey (based on two weeks recall method)	37.2%
Children aged 0-59 months that reported of having ARI during the past 14 days to the survey (based on two weeks recall method)	20.1%
Measles vaccination status for the children aged 9-59 months based on both recall and vaccination card confirmation	61.8%

Nutrition status among Pregnant and Lactating Women (N=313)	
Indicators	Result
Undernutrition among Pregnant Women based on MUAC <230 mm	50.8%
Undernutrition among only Lactating Women based on MUAC < 230 mm	28.0%
Undernutrition among Pregnant and Lactating Women (PLWs) based on MUAC <230mm	37.1%

2. INTRODUCTION

Kandahar is one of the thirty-four provinces of Afghanistan, located in the southern part of the country next to Pakistan. It is surrounded by Helmand in the west, Uruzgan in the north and Zabul Province in the east. Its capital is the city of Kandahar, which is located on the Arghandab River.

The province has 16 districts such as Arghand Ab, Arghistan, Daman, Ghorak, Khakriz, Maruf, Maywand, Miyانشin, Nesh, Panjwaye, Reg, Shah wali kot, Shorabak, Spin boldak, Zhari and Kandahar. Kandahar is the capital and main city of this province.

Map: Drought affected area of Afghanistan and location of survey

The population of the province is about 1,279,520¹, which is mostly tribal and a

rural society. The inhabitants of Kandahar province are ethnic Pashtuns, although smaller communities of Tajiks, Hazaras, Uzbeks and Baloch are also found in parts of the city of Kandahar. The main language spoken in the province is Pashto but in some urban centers, Dari (Afghan Persian) is also in use as a second language.

There are different tribes in the province, but two major tribes are Durani and Galzai. Durani tribes has different ethnics such as Popalza, Alikozai, Barakzai, Achakzai the second major tribe is Ghalzai such as Tokhi, Nurzai, Hotak, Taraki, Loudin.

Kandahar is also one of the provinces that recently seriously affected by drought. OCHA has categorized Kandahar as one of the “Critical” drought affected province. Nutrition Cluster along with Assessment and Information Management Working Group/PND/MoPH through different meetings decided to conduct one Rapid SMART assessment in Panjwayi and Zhair districts.

¹ Updated CSO population 1396 (2017- 2018)

Based on the different SMART surveys conducted in recent years as well as latest information available from other sources, Kandahar province have been identified as prioritized location to do nutrition survey. The last SMART survey conducted in Kandahar was during August 2015.

2.1. HEALTH AND NUTRITION PROGRAMME BACKGROUND OF BPHS IN KANDAHAR PROVINCE

There are many NGOs working in Kandahar city but only four NGOs are specifically working in nutrition program such as BARAN under the BPHS program offers the BPHS package in all health facilities of Kandahar province. SCI has also been running nutrition program in Bouldak district and in the Capital of Kandahar province; MEDAIR and INTERSOS also offering IMAM services by Mobile team in remote area of Kandahar city.

BARAN is the BPHS implementer in Kandahar province that have 61 Health facilities (HF), 616 Health Posts (HP) and 7 mobile teams in Kandahar province, A total of 2 IPD SAM center, 41 OPD SAM . At the area of assessment (Panjwayi and Zhari districts) total has 8 HF, out of them 8 Hfs have, OPD SAM and no OPD MAM and IPD SAM in the districts.

During the assessment a total of 81 malnourished children were found based on MUAC (55 MAM and 26 SAM and referred to the nearest Health facilities to receive the treatment. Only one of the malnourished children was enrolled in nutrition treatment (while unable to show the documentation).

2.2. OBJECTIVE OF THE SURVEY

2.2.1. MAIN OBJECTIVE

- To quickly evaluate the nutrition situation of children U5 and PLWs in the drought affected area of Kandahar province (Panjwayi and Zhari districts).

2.2.2. SPECIFIC OBJECTIVES

- To broadly estimate Global Acute Malnutrition (GAM) rates among children from 6- 59 months living Panjwayi and Zhari districts of Kandahar province.
- To estimate two weeks recall morbidity among children from 0- 59 months living in Panjwayi and Zhari districts of Kandahar province.
- To estimate measles vaccination coverage among children from 9 - 59 months living in Panjwayi and Zhari districts of Kandahar province.

- To estimate prevalence of malnutrition among pregnant and lactating women (PLWs) based on MUAC cut-offs.

2.3. JUSTIFICATION OF THE SURVEY

- Kandahar province categorized as “critical” based on OCHA analysis for recent drought in Afghanistan.
- Internal displaced population (IDPs) mainly in Panjwayi and Zhrai districts due to drought.
- Possible deterioration of health and nutrition situation due to drought and conflict related issues causing food insecurity in the area that require updated information.
- The area was selected by nutrition cluster and AIM-Working Group to know the nutrition situation in the districts.

3. SAMPLE SIZE, SAMPLING DESIGN AND PROCEDURES

3.1. SAMPLE SIZE AND SAMPLING DESIGN

The population assessed are inhabitants living in the group of affected villages, meaning several settlements and households were assumed to be living in the area more than 200. As there is more than ONE settlement and the population is dispersed: two stage cluster sampling has been used. The number of clusters was also fixed to a minimum of 25 with 200 minimum number of children (6-59 months) required. It has been selected using two-stage cluster sampling. The table below presents the precision, which was expected to be reached, according to the GAM result. The table below presents the precision, which was expected to be reached, according to the GAM result.

Expected GAM Prevalence	Sample Size	Precision
20%	200 children	+/- 7.1%
15%	200 children	+/- 6.3%
10%	200 children	+/- 5.3%
5%	200 children	+/- 3.9%

To reach the required number of sample, Rapid SMART assessment for Afghanistan proposed simplified rule to convert children into households:

- A. When the percentage of children under age of 5 is below 15%, 25 clusters of 12 households have to be selected
- B. When the percentage of children under age of 5 is above 15%, 25 clusters of 10 households have to be selected

The reference percentage of under-5 population for Afghanistan which is 15.6% (Afghanistan Mortality Survey 2010), so conversion option B was applied. So 25 Clusters of 10 households were selected randomly using PPS by ENA software out of the list. The total number of HH to be surveyed was 250, So, 25 clusters of 10 households were selected randomly using ENA for SMART software 2011 latest version (9th July 2015) from the list of villages.

3.2. FINAL SAMPLING STRATEGY

In total, 24 clusters were visited. One cluster could not be accessed due to some security problem. 5 HHs refused to take part in the assessment process ; a total HHs of 235 were surveyed. Clusters were mainly based on villages (please see the cluster selection is in Annex-2). Table-1 makes a summary of the achieved samples (household, children).

Table 1: Details of proposed and actual sample size achieved

Number of cluster planned	Number of cluster surveyed	% of cluster surveyed	Number of HH planned	Number of HH surveyed	% HH surveyed	Number of children 6-59 months planned	Number of children 6-59 months surveyed	% children surveyed
25	24	96%	250	235	94.0 %	200	518	259.0%

Data was analyzed with ENA for SMART software (2011 version updated 9th July 2015). Additional data (morbidity, measles vaccination and women nutritional status) was analyzed using Microsoft Excel.

3.3. SAMPLING PROCEDURES

Two-stage cluster sampling methodology was employed in this survey.

Stage 1: Clusters/ Villages Selection

Random selection of clusters/villages was done using probability proportionate to size (PPS) using ENA for SMART software version 2011 of (updated 9th July, 2015). There were 722 cluster/villages in the original sampling frame but 50 clusters were systematically excluded because of insecurity and inaccessibility, meaning 6.9% clusters/villages excluded from the original sampling frame.

In case of large villages in a cluster, the village was divided into smaller segments and one segment was selected randomly to include the cluster. This division was done based on existing landmarks in the area, pathways, water points, mosques, health facilities, schools etc.

Stage 2: Households:

It was extremely difficult to obtain an updated list of Households; hence systematic random sampling was used instead of SRS method to identify the households surveyed. The teams were trained on both methods of sampling (simple and systematic random sampling) and they were offer with materials to assist in determining the households during the data collection exercise

Again, for the sake of simplification and rapidity, polygamous families were accounted as ONE household In each selected village, one or more community member(s) was ask to help the survey teams to conduct their work by providing information about the village with regard to the geographical organization or the number of households.

Children

All children from 0 to 59 months of age living in selected households were included in the cluster (6-59 for anthropometry and <6 month for other health part). Age being very difficult to investigate and to ascertain, the high prevalence of stunting in Afghanistan impairs the relevance of height benchmarks to identify simply an age category.

Careful age identification by use of locally developed event calendar, child dental chart, etc. was apply. Local event calendar can be update if there is one from previous studies. If there is none, than a calendar including events of only border months can be rapidly elaborate with the staffs during the training. **It is important to note that the official calendar in Afghanistan is the solar**

Hijri calendar (Iranian calendar). The use of the Gregorian calendar can introduce bias and confusion while interviewing caretakers and therefore can cause additional loss of time.

Maternal Health and Nutrition

Women in childbearing age were assessed for their nutritional status based on MUAC measurements. The nutritional status of pregnant and lactating mothers were derived from the MUAC cut-off of 230 mm.

3.4. DATA COLLECTION

A simple tally sheets instead of a questionnaire was use (ANNEX 3 and 4) where surveyors would simply write down these data for each child. The number of the child in the household and the number of the household in the cluster is record too.

Anthropometric data

The **sex** has to be record with codes: f = female and m=male.

The **age** was written down in months. The preparation and the use on the field of tools to determine age could time consuming and require previous preparation (e.g. Event calendar). The teams had at maximum sensitized to the importance of the age record.

Weight (in kg): Children were weighed to the nearest 0.1 kg by using an Electronic Uniscale (or SECA). The children who could easily stand were ask to stand on the weighing scale and their weight was record. In a situation when the children could not stand up, the double weighing method was applied.

Height/Length (in cm): Measuring board used to measure bare headed and barefoot children. The precision of the measurement was 1 mm. Children of less than 2 years were measured lying down (length) and those equal to or above 2 years measured standing up (Height).

All children checked for **Bilateral Pitting Oedema**. It was essential that all staff well trained to check for Oedema on both feet.

MUAC was taken on the **LEFT** arm using flexible MUAC tape. The MUAC measurement had recorded in mm.

All children detected as SAM whether by presence of bilateral pitting edema and/ or MUAC <115 mm, referred to the nearest facility or agency responsible for therapeutic care for immediate treatment in this case BARAN BPHS implementer organization.

Measles immunization status

For all children selected in the sample, the mother/caretaker (CT) asked if the child has been immunized against measles or not, and if there was a vaccination card? The answers was recorded as 'Y' (Yes); 'VWC' (Vaccination without Card); 'N' (No); 'DK' (Does not Know), according to the situation

Morbidity data

For all children selected in the sample, the mother/CT was ask :

- If the child had diarrhea within the last 14 days. Diarrhea is defined as every episode of more than 3 liquid stools per day. Record was made as follows: 'Y' (Yes); 'N' (No); 'DK' (Does not Know)
- If the child had Acute Respiratory Infection (ARI) within the last 14 days. Acute Respiratory infection is any episode with severe, persistent cough or difficulty breathing.
- Record was made as follows: 'Y' (Yes); 'N' (No); 'DK' (Does not Know), according to the Situation.

3.5. TRAINING AND SUPERVISION

Eight teams of two members in each team (one female and one male) conducted the field data collection. Each two teams had one supervisor. The previous experience from Afghanistan has shown that in some cases people are not eager to allow surveyors to measure female children. It is important to bear that in mind while conducting Rapid SMART assessment and to have as much as possible mixed teams of surveyors that have adapted communication approach. ACF SMART technical team, PPHD PNO Public Nutrition Officer and BPHS M&E officer supervised the teams

Enumerator Training Picture

This survey utilized the eight-community Males enumerators, eight community Females enumerators and 2-cluster supervisor recommended by BARAN and 2 more cluster supervisor recommended by PPHD of Kandahar office for this assessment. In this case, the teams received a 4 days training on data collection for Rapid SMART assessment, which includes a 1-day standardization test. It was expected that based on the teams experience with Health and Nutrition services they were more aware and skilled to properly execute the data collection activities for the Rapid SMART assessment.

Survey Supervision picture

One field guidelines document with instructions and household definition and selection document were provided to each team member. All documents, such as local event calendar, questionnaires or consent forms were translated in Pashto local language, for better understanding and to avoiding direct translation during the field data collection. The questionnaires were back translated using a different translator. Alterations were made as necessary.

3.6. DATA ANALYSIS

The anthropometric data was analyzed by using ENA for SMART software 2011 version, with July 9th 2015 update. Survey results were presented in reference to WHO growth standards 2006 for overall final analysis.

After data has been entered and quality check performed by ENA, the software generates a gender specific table with MUAC/oedema results (and if this is the case: Wasting and stunting). The software ENA automatically calculates confidence intervals.

ENA generates automatically table for MUAC results using cut-offs presented below:

Classification	Normal	Moderate Acute Malnutrition	Severe acute malnutrition
MUAC	≥125mm	≥115 to <125 mm	<115mm and/or Oedema

If the weight and the height have been assessed, ENA can generate a survey report automatically. If all anthropometric measurements are collected, than ENA was generating results for Acute Malnutrition (WHZ), Stunting (HAZ), and Underweight (WAZ). Results are presented in % **Z-scores with 95% Confidence Interval**. These are defined as follows:

Table 2: Classification and definition of wasting, underweight and stunting

	Wasting	Underweight	Stunting
Global	WHZ <-2 z scores and/or Oedema	WAZ <-2 z scores	HAZ <-2 z scores
Moderate	-3 < WHZ < -2 z scores	-3 < WAZ < -2	-3 < HAZ < -2 z scores
Severe	WHZ < -3 z scores and/or Oedema	WAZ < -3 z scores	HAZ < -3 z scores

3.7. SURVEY LIMATION

- Security problem
- Lack of updated list of Households in the villages

- 50 villages (6.9%) were excluded from the original sampling frame due to insecurity and lack of access.
- Inaccuracy of some villages level population data; some villages found that was smaller or larger than anticipated on visits time during data collection.
- Most of the children (97%) didn't have vaccination card and those who had card – there were often no mention of exact date of birth or in some cases wrong date of birth.

4. RESULTS

4.1. DATA QUALITY

The overall data quality for the survey was classified as “Good” with an overall score of 12% based on the ENA plausibility test. The SD was categorized as acceptable 1.15 (the SD should be between 0.8 to 1.2) among the surveyed children, boys and girls were equally represented (boys/girls ratio was 1.11 with $p=0.219$). The age ratio of 6-29 months to 30-59 months was 0.90, (The value should be around 0.85): $p\text{-value} = 0.537$ (as expected).

4.2. Anthropometric Results:

Estimation of GAM prevalence was done based on WHO 2006 child growth standards and the results are presented with exclusion of z- score from observed mean SMART flags: WHZ -3 to +3, HAZ -3 to +3 and WHZ -3 to +3. the overall data quality check is shown in **Annex 2**. See table below for distribution of age and sex sample.

Table 3: Distribution of age and sex of sample

	Boys		Girls		Total		Ratio
AGE (mo)	no.	%	no.	%	no.	%	Boy : Girl
6-17	65	50.4	64	49.6	129	24.9	1.0
18-29	66	56.9	50	43.1	116	22.4	1.3
30-41	72	54.5	60	45.5	132	25.5	1.2
42-53	46	50.0	46	50.0	92	17.8	1.0
54-59	24	49.0	25	51.0	49	9.5	1.0
Total	273	52.7	245	47.3	518	100.0	1.1

Table 4: Prevalence of acute malnutrition based on WHZ (and/or edema) disaggregated by sex

	All n = 507	Boys n = 269	Girls n = 238
Prevalence of global acute malnutrition (<-2 z-score and/or oedema)	(70) 13.8 % (10.2 - 18.5 95% C.I.)	(32) 11.9 % (7.9 - 17.6 95% C.I.)	(38) 16.0 % (11.1 - 22.4 95% C.I.)
Prevalence of moderate acute malnutrition (<-2 z-score and ≥-3 z-score, no oedema)	(58) 11.4 % (8.1 - 16.0 95% C.I.)	(25) 9.3 % (5.7 - 14.8 95% C.I.)	(33) 13.9 % (9.6 - 19.6 95% C.I.)
Prevalence of severe acute malnutrition (<-3 z-score and/or oedema)	(12) 2.4 % (1.2 - 4.6 95% C.I.)	(7) 2.6 % (1.0 - 6.4 95% C.I.)	(5) 2.1 % (0.9 - 4.9 95% C.I.)

Table 5: Distribution of acute malnutrition and edema based on WHZ

	<-3 z-score	≥-3 z-score
Edema present	Marasmic kwashiorkor No. 0 (0.0 %)	Kwashiorkor No. 0 (0.0 %)
Edema absent	Marasmic No. 18 (3.5 %)	Not severely malnourished No. 500 (96.5 %)

There were no cases of Oedema found during the survey (0%).

Table 6: Prevalence of acute malnutrition based on MUAC cut offs (and/or edema) and by sex

	All n = 518	Boys n = 273	Girls n = 245
Prevalence of global acute malnutrition (<125 mm and/or edema)	(81) 15.6 % (11.5 - 21.0 95% C.I.)	(39) 14.3 % (9.6 - 20.7 95% C.I.)	(42) 17.1 % (11.2 - 25.4 95% C.I.)

Prevalence of moderate acute malnutrition (<125 mm and \geq 115 mm, no edema)	(55) 10.6 % (7.8 - 14.3 95% C.I.)	(26) 9.5 % (6.5 - 13.7 95% C.I.)	(29) 11.8 % (8.1 - 16.9 95% C.I.)
Prevalence of severe acute malnutrition (<115 mm and/or edema)	(26) 5.0 % (3.0 - 8.2 95% C.I.)	(13) 4.8 % (2.5 - 9.0 95% C.I.)	(13) 5.3 % (2.3 - 11.6 95% C.I.)

Table 7: Prevalence of Acute Malnutrition based on combine criteria (MUAC+WHZ+Oedema)*

	Results
Prevalence of global acute malnutrition based on both criteria (WHZ <-2SD and/or MUAC <125mm and/or Oedema)	22.3% (17.7 - 27.7; 95% CI)
Prevalence of severe acute malnutrition based on combined criteria (WHZ <-3SD and/or MUAC <115mm and/or Oedema)	6.5% (4.1 - 10.1; 95% CI)

*The combined GAM and SAM estimation was performed manually by changing all the MUAC only GAM/SAM data into Oedema in the ENA software to provide an aggregated prevalence under the result category of WHZ and/or Oedema.

Table 8 Prevalence of underweight based on weight-for-age z-scores and by sex

	All n = 515	Boys n = 272	Girls n = 243
Prevalence of underweight (<-2 z-score)	(123) 23.9 % (19.8 - 28.5; 95% C.I.)	(69) 25.4 % (19.5 - 32.3; 95% C.I.)	(54) 22.2 % (16.3 - 29.5; 95% C.I.)
Prevalence of moderate underweight (<-2 z-score and \geq -3 z-score)	(87) 16.9 % (14.2 - 20.0; 95% C.I.)	(47) 17.3 % (12.9 - 22.7; 95% C.I.)	(40) 16.5 % (12.4 - 21.5; 95% C.I.)
Prevalence of severe underweight (<-3 z-score)	(36) 7.0 % (4.7 - 10.2; 95% C.I.)	(22) 8.1 % (5.1 - 12.7; 95% C.I.)	(14) 5.8 % (2.9 - 11.1; 95% C.I.)

Table 9: Prevalence of stunting based on height-for-age z-scores and by sex

	All n = 515	Boys n = 272	Girls n = 243
Prevalence of stunting (<-2 z-score)	(230) 45.1 % (40.3 - 50.0; 95% C.I.)	(146) 54.5 % (48.1 - 60.7; 95% C.I.)	(84) 34.7 % (29.2 - 40.7; 95% C.I.)
Prevalence of moderate stunting (<-2 z-score and ≥-3 z-score)	(147) 28.8 % (24.5 - 33.6; 95% C.I.)	(85) 31.7 % (26.3 - 37.7 95% C.I.)	(62) 25.6 % (21.3 - 30.5 95% C.I.)
Prevalence of severe stunting (<-3 z-score)	(83) 16.3 % (13.5 - 19.5; 95% C.I.)	(61) 22.8 % (18.5 - 27.7; 95% C.I.)	(22) 9.1 % (5.8 - 13.9; 95% C.I.)

The summary of the Mean Z-scores with their Standard Deviations, the design effects and number of the out of range data per index is the table 10 below.

Table 10: Mean z-scores, design effect and excluded subjects

Indicator	N	Mean z-scores ± SD	Design Effect (z-score < -2)	z-scores not available*	z-scores out of range
Weight-for-Height	507	-0.61±1.15	1.68	0	11
Weight-for-Age	515	-1.47±0.90	1.24	0	3
Height-for-Age	510	-1.89±1.07	1.15	0	8

*Contains for WHZ and WAZ the children with edema (if any).

4.3. CHILD HEALTH AND IMMUNIZATION

Retrospective morbidity data was collected among all children 0-59 months, with the 2 weeks recall period assessed the occurrence of main diseases. All children aged from 9 to 59 months were assessed whether they ever received measles vaccine or not. Analysis of data and findings illustrated in table 11 and 12.

Table 11: Under-five morbidity, two week recall (N=551)

Parameters	Frequency	Results
Acute Respiratory Infection	111	20.1%
Diarrhea	205	37.2%

Table 12: Measles immunization status, children 9-59 months (N=490)

Parameters	Frequency	Results
Yes, confirmed by card	10	2.0%
Yes, recall	293	59.8%
Yes by both card and recall	303	61.8%
No	175	35.7%
Don't Know	12	2.4%

4.4. MATERNAL NUTRITION STATUS

The information on maternal nutrition status was collected only for women at childbearing age (CBA), from 15 to 49 years. The results illustrated in the tables 13 and 14 below.

Table 13: Physiological status of women of reproductive age (15-49 years), n=487

Status	Frequency	Results
Pregnant Women	124	39.6%
Lactating Women	189	60.4%
Non-pregnant & non-Lactating women	174	55.6%

Table 14: Nutrition status of Pregnant and Lactating women based on MUAC cut off

Parameters (N=313)	Frequency	Results
Global Acute Malnutrition of PLW based on MUAC <230mm	116	37.1% (31.7-42.4 95% CI)
Sever acute malnutrition of PLW based on MUAC <185 mm	0	0.0%

*The cut-offs were used according to national IMAM guideline.

5. DISCUSSION

5.1. UNDER NUTRITION RATES

Results of this survey is not reflecting of the provincial nutrition situation but are representative of only for the Panjwayi and Zhari ditRICTS. The results of the survey shows a prevalence of Global Acute Malnutrition (GAM) based on weight-for-height Z-score was 13.8% (10.2 – 18.5 95% C.I.) and SAM rate 2.4% (1.2 – 4.6 95% CI). According to WHO threshold² GAM is classified serious public health situation in Panjwayi and Zhari districts of Kandahar province and GAM prevalence based on MUAC<125 mm was 15.6% (11.5 -21.0 95% CI) and SAM (MUAC <115mm) was 5.0% (3.0 – 8.2 95% CI) respectively.

The combined MUAC and WHZ prevalence revealed GAM and SAM prevalence of **22.3% (17.7 – 27.7; 95% CI)** and **6.5% (4.1 – 10.1; 95% CI)** respectively. According to this combined GAM and SAM prevalence, the nutritional situation is very critical in the province. The combined rate informs the total estimated SAM and MAM caseload in the assessment area for better programing. All the children in the sample detected as acutely malnourished (either by MUAC or WHZ or Oedema) are brought into the calculation according to combined criteria. To detect all acute malnourished children eligible for treatment, the MUAC only detection is not enough according to Afghanistan IMAM Guidelines.

Further analysis suggests that these rates do not refer to overlapping of same children. Children classified as wasted based on MUAC only is 38.1%, based on WHZ only is 30.1% and the rest

² WHO acute malnutrition classification : <5% acceptable, 5-9% poor, 10-14% serious, >15% critical (without aggravating factors)

31.9% children are malnourished based on both WHZ and/or MUAC criteria. If both criteria combined the overall prevalence of children likely to be eligible for SAM and MAM management program in Panjwayi and Zhari districts of Kandahar province was found 22.3% while the SAM alone is analyzed using combined WHZ and/or MUAC criteria then the SAM prevalence is projected at 6.5%. Combined rates recommended being use for caseload estimation of SAM and MAM management in the assessed health facilities coverage areas.

Prevalence of Stunting rate was **45.1% (40.3 – 50.0 95% C.I.)** Based on the survey finding in every 3 people more than one person has chronic malnutrition or stunting.

The prevalence of underweight was at **23.9% (19.8 – 28.5 95% CI)**; this from of under-nutrition depicts the burden of acute and chronic under-nutrition among under-fives.

5.2. CHILD HEALTH AND IMMUNIZATION

Prevalence of diarrhea **37.2%** and ARI **20.1%** reported in Panjwaye and Zhari districts of Kandahar province, illness is one of contributing factors of under nutrition.

The low coverage (**61.8 %**) of measles vaccination illustrates the hindrance in accessing the basic health services in the area, with coverage below the WHO thresholds of >80%

5.3. NUTRITIONAL STATUS OF PREGNANT AND LACTATING WOMEN

The nutritional situation of PLW is very much worrying in the survey location. 37.1% PLWs are malnourished while a staggering 50.8% pregnant women are malnourished based on MUAC <230mm. So one in every two pregnant women is malnourished in Panjwayi and Zhari districts of Kandhar province.

5.3. RECOMMENDATIONS AND JOINT ACTION PLAN

Key findings	Explanation	Actions to be taken	By who?	Resources required	Timeline of implementation
High GAM Prevalence based on WHZ	GAM prevalence based on WHZ is 13.8% (10.2%-10.8% 95% C.I) which is serious situation according to the WHO threshold	BARAN has 8 OPD-SAM sites in all 8 BPHS HFs of Zhari and Panjwayi districts and provides nutrition services include Screening, IYCF counseling, RUTF supply, etc. There is gap of OPD-MAM program since end of 2017 and starting TSFP program is one of the top priorities.	WFP re-allocate MAM supplies through TSFP project	MAM commodities include super cereal, RUSF and budget for operation.	From August 2018
High Combined GAM prevalence	Based on both criteria (MUAC and WHZ) GAM prevalence is 22.3% and SAM 6.5% which is critical situation according to the WHO threshold.	BARAN will focus on quality of SAM program and will ask WFP to start OPD-MAM program through its TSFP project.	BARAN & WFP	SAM and MAM supplies	Regular
High Chronic Malnutrition	Stunting in the area covered by the Rapid SMART survey was 45.1%, Which very high	BARAN through its BPHS HFs will re-assessed the underlying causes of the malnutrition and will work with communities for behavior change, food	BARAN	Financial support for food demonstration events	Regular

	according to the WHO threshold.	diversification and conduction of food demonstration events.			
Low coverage of Immunization (Measles)	<p>According to the WHO SPHER standard for the National target measles >80%. However, according to the Rapid SMART survey finding the measles coverage was 61.5% which is low than WHO threshold.</p>	<p>the issue Maybe because of not being able to show vaccination cards by mothers/caregivers or some other reasons. BARAN has had good progress since taken over the BPHS project in July 2015. They increased number of EPI team members at provincial level from 1 to 4. Trained (51) midwives on EPI and they can implement vaccines as back up vaccinators, BARAN has full membership of regional EOC and actively participate in micro planning. Implementation of measles and polio campaigns, in last year BARAN responded to outbreaks of Measles in Kandahar, BRAN Community Health Supervisors participated to 885 EPI outreach sessions with vaccinators and CHWs to 2146 sessions as well. BARAN mobilized communities especially those refused vaccinations through establishing 14 refusal committees at 8 districts of</p>	<p>BARAN in close coordination with PPHD/REMT, WHO, UNICEF and other related stakeholders</p>	<p>Review of EPI micro-plan and increase the number and quality of outreach campaign activities include health education at HFs level</p>	<p>Regular</p>

		Kandahar include Zharai and Panjwayi. EPI is first priority for us and is main topic of health education sessions at HFs and community level sessions. 8584 education session on EPI conducted at HFs level and 5508 at community level during last year. We are optimistic to achieve targets by using mentioned and other strategies.			
Maternal Nutrition status	GAM prevalence of PLWs based on MUAC was 37.1%. Which is very high.	There is gap of OPD-MAM program since end of 2017 and starting TSFP program is one of the top priorities. BARAN also will focus on community awareness and food diversity education.	WFP and BARAN	MAM supplies and Nutrition education sessions	Regular
General observation (Poor Hygiene practice, Poor access to safe drinking water, High disease rate at the time and poor food security status of the community)	These are multi-sectorial tasks	BARAN through its HFs and community programs will increase community awareness regarding mentioned topics and the issues will be raised in Kandahar PHCC and PDC meetings for involvement of related stakeholders.	BARAN provincial management and stakeholders	TBD	Regular

Evaluation of Standard deviation, Normal distribution, Skewness and Kurtosis using the 3 exclusion (Flag) procedures

	no exclusion	exclusion from	exclusion from
.		reference mean	observed mean
.		(WHO flags)	(SMART flags)

WHZ

Standard Deviation SD:	1.28	1.25	1.15
(The SD should be between 0.8 and 1.2)			
Prevalence (< -2)			
observed:	14.7%	14.5%	13.8%
calculated with current SD:	13.8%	13.2%	11.4%
calculated with a SD of 1:	8.3%	8.1%	8.2%

HAZ

Standard Deviation SD: 1.25 1.13 1.07

(The SD should be between 0.8 and 1.2)

Prevalence (< -2)

observed:	44.8%	45.0%	45.1%
calculated with current SD:	45.1%	45.8%	46.0%
calculated with a SD of 1:	43.9%	45.2%	45.7%

WAZ

Standard Deviation SD: 0.95 0.95 0.90

(The SD should be between 0.8 and 1.2)

Prevalence (< -2)

observed:

calculated with current SD:

calculated with a SD of 1:

Results for Shapiro-Wilk test for normally (Gaussian) distributed data:

WHZ	p= 0.000	p= 0.000	p= 0.000
HAZ	p= 0.000	p= 0.636	p= 0.198
WAZ	p= 0.000	p= 0.000	p= 0.000

(If $p < 0.05$ then the data are not normally distributed. If $p > 0.05$ you can consider the data normally distributed)

Skewness

WHZ	-0.18	-0.04	-0.28
HAZ	1.38	0.09	0.05
WAZ	0.01	0.01	-0.57

If the value is:

- below minus 0.4 there is a relative excess of wasted/stunted/underweight subjects in the sample
- between minus 0.4 and minus 0.2, there may be a relative excess of wasted/stunted/underweight subjects in the sample.
- between minus 0.2 and plus 0.2, the distribution can be considered as symmetrical.
- between 0.2 and 0.4, there may be an excess of obese/tall/overweight subjects in the sample.
- above 0.4, there is an excess of obese/tall/overweight subjects in the sample

Kurtosis

WHZ	1.08	0.60	-0.49
HAZ	9.05	0.17	-0.39
WAZ	2.53	2.53	0.61

Kurtosis characterizes the relative size of the body versus the tails of the distribution. Positive kurtosis indicates relatively large tails and small body. Negative kurtosis indicates relatively large body and small tails.

If the absolute value is:

- above 0.4 it indicates a problem. There might have been a problem with data collection or sampling.
- between 0.2 and 0.4, the data may be affected with a problem.
- less than an absolute value of 0.2 the distribution can be considered as normal.

Test if cases are randomly distributed or aggregated over the clusters by calculation of the Index of Dispersion (ID) and comparison with the Poisson distribution for:

WHZ < -2: ID=1.55 (p=0.045)

WHZ < -3: ID=1.22 (p=0.216)

GAM: ID=1.55 (p=0.045)

SAM: ID=1.22 (p=0.216)

HAZ < -2: ID=0.59 (p=0.939)

HAZ < -3: ID=0.70 (p=0.847)

WAZ < -2: ID=1.07 (p=0.366)

WAZ < -3: ID=1.33 (p=0.131)

Subjects with SMART flags are excluded from this analysis.

The Index of Dispersion (ID) indicates the degree to which the cases are aggregated into certain clusters (the degree to which there are "pockets"). If the ID is less than 1 and $p > 0.95$ it indicates that the cases are UNIFORMLY distributed among the clusters. If the p value is between 0.05 and 0.95 the cases appear to be randomly distributed among the clusters, if ID is higher than 1 and p is less than 0.05 the cases are aggregated into certain cluster (there appear to be pockets of cases). If this is the case for Oedema but not for WHZ then aggregation of GAM and SAM cases is likely due to inclusion of oedematous cases in GAM and SAM estimates.

Are the data of the same quality at the beginning and the end of the clusters?

Evaluation of the SD for WHZ depending upon the order the cases are measured within each cluster (if one cluster per day is measured then this will be related to the time of the day the measurement is made).

Time	SD for WHZ
point	0.8 0.9 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8 1.9 2.0 2.1 2.2 2.3
